Harnessing Geospatial Intelligence for Africa's Sustainable and Resilient Future

17-21 November 2025, Alisa Hotel, Accra, Ghana

PRESENTATION OUTLINE

- Introduction
- Significance of study
- Aim & Specific Objectives
- Methodology
- Results and Discussion
- Conclusion and Recommendations
- Acknowledgement

INTRODUCTION

- Land Degradation (LD) is the reduction in biodiversity and ecosystem functioning, impacting ecosystem services (IPBES, 2018; Petrosillo et al. 2023).
- LD has compromised the land's ability to fulfill its functions.
- LD causes \$400 billion in losses annually, impacting 1.5 billion people worldwide (Jiang et al., 2022; Uthappa et al., 2023; Anteneh & Zewide, 2021).
- The UNCCD seeks to combat LD through advocating Land Degradation Neutrality (LDN).

INTRODUCTION

- LDN aim to reverse, reduce, and restore degraded lands by the year 2030 (Cowie, 2020).
- Land is humanity's most valuable resource, forming the foundation for all other resources.
- Monitoring LDN and its drivers aid decision-making (Hannam, 2022; Jiang et al., 2022).
- Ghana targets rehabilitation of degraded mine sites and 882.86 km² of forest by 2030 (UNCCD,2017). This study will monitor progress towards LDN in the Birim North Mining Community.
- The study monitors progress towards LDN in the Birim North Mining Community.

SIGNIFICANCE OF STUDY

- The study provides the baseline for assessment of LD for policymakers and stakeholders, facilitating informed decision-making and sustainable land management practices;
- It provides status of LDN in mining communities;
- It offers tailored solutions to improve livelihood of residents in mining communities.

AIM & SPECIFIC OBJECTIVES

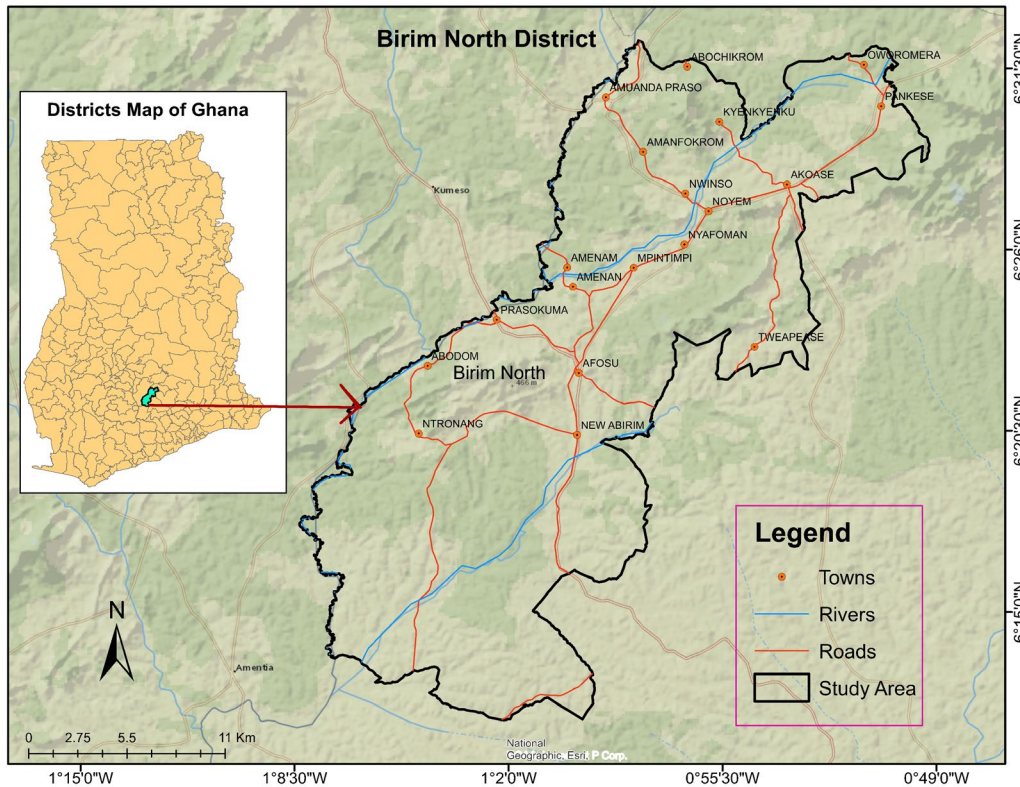

SPECIFIC OBJECTIVES:

- This study aims to monitor and assess LDN in the Birim North mining community.

- To map the extent of land degradation in the Birim North district.
- To assess evidence of rehabilitation efforts; and analyze the perception of mining communities on rehabilitation activities.
- To examine the drivers influencing the achievement of Land Degradation Neutrality
- To examine the sustainability of rehabilitation methods used.

METHOD: STUDY AREA

Study Area

- **Climate:** Semi-equatorial, double rainfall peaks (1,500–2,000 mm), warm temps (25–28 °C); supports cocoa & oil palm.
- **Geology:** Gold-rich Birimian & Tarkwaian rocks; driving mining.
- **Vegetation:** Semi-deciduous forest rapidly declining due to mining and farming.
- **Relief:** Mountainous (112–497 m), drained by Pra & Birim Rivers.
- **Population:** 82,669 people; livelihoods rely on farming and mining.

MATERIALS & SOFTWARE

Data Sources

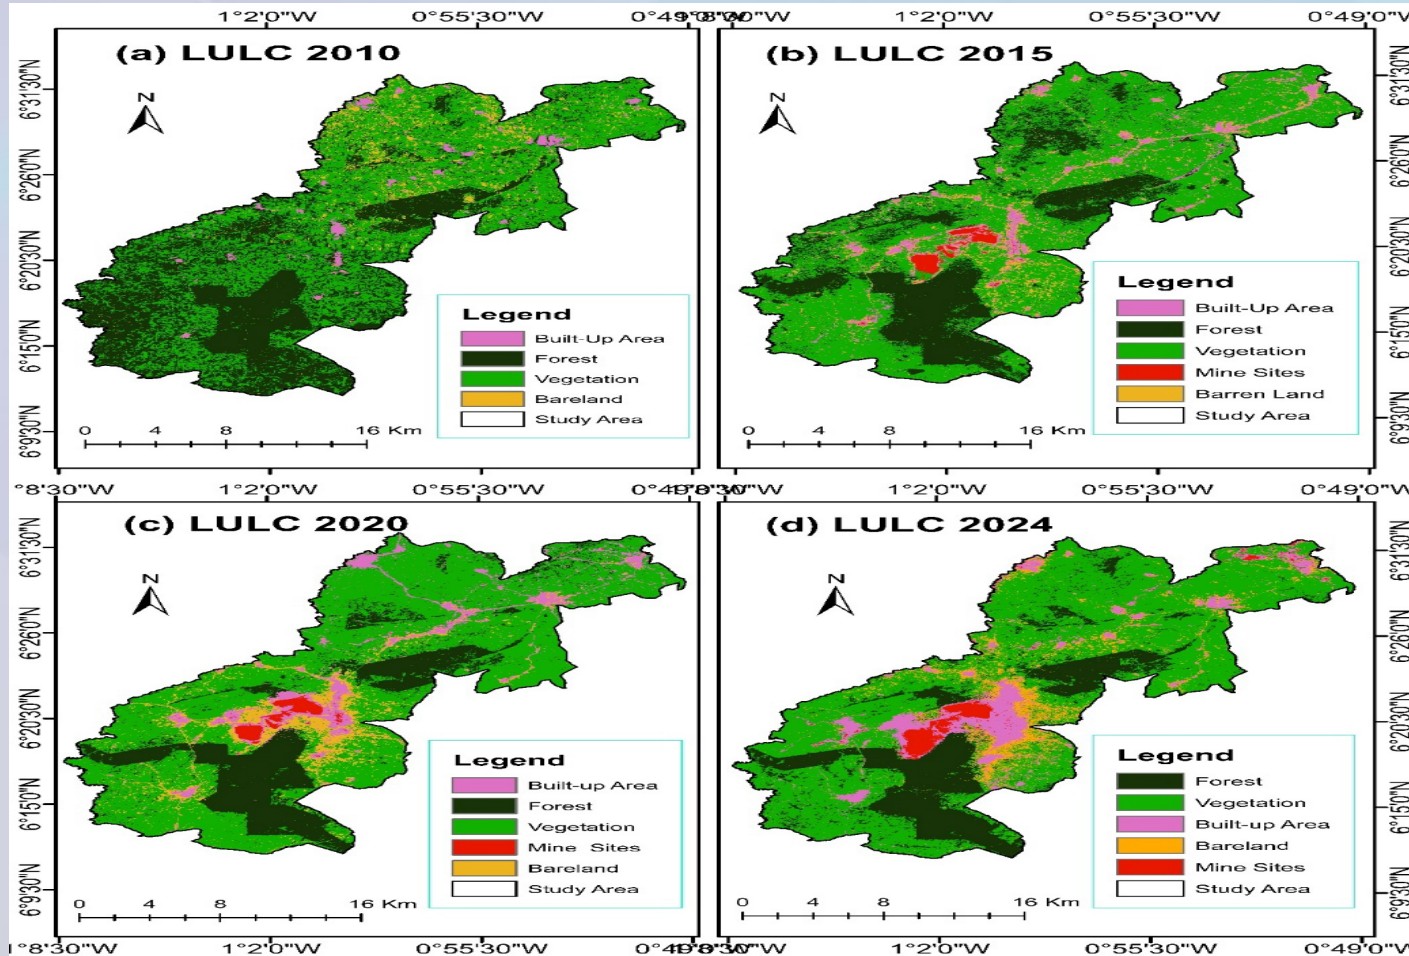

- Landsat imagery 7 ETM+ for the year 2010 from USGS.
- Sentinel imagery for the years 2015, 2020, & 2024 from Copernicus.
- Field Surveys.
- Stakeholder Interviews.

| Software | Purpose |
|------------------|--|
| ArcGIS 10.8 | Mapping and GIS Analysis |
| QGIS 3.28 | Mapping and GIS Analysis |
| Google Earth Pro | Time-series analysis and Classification validation, and Mine sites digitization. |
| MS Excel | LULCC analysis and graphs, and questionnaire analysis. |

RESULTS & DISCUSSION

LULC Changes from 2010 to 2024

LULC from 2010 to 2024

| Class name | Area in 2010 (km ²) | Area in 2024 (km ²) | % change (2010 - 2024) |
|---------------|---------------------------------|---------------------------------|------------------------|
| Forest | 235.35 | 117.15 | -50.22 |
| Vegetation | 288.47 | 341.47 | 18.37 |
| Built-Up area | 13.34 | 51.92 | 289.21 |
| Bare land | 29.84 | 42.73 | 43.20 |
| Mine sites | - | 13.73 | - |
| Total | 567.00 | 567 | |

RESULTS & DISCUSSION

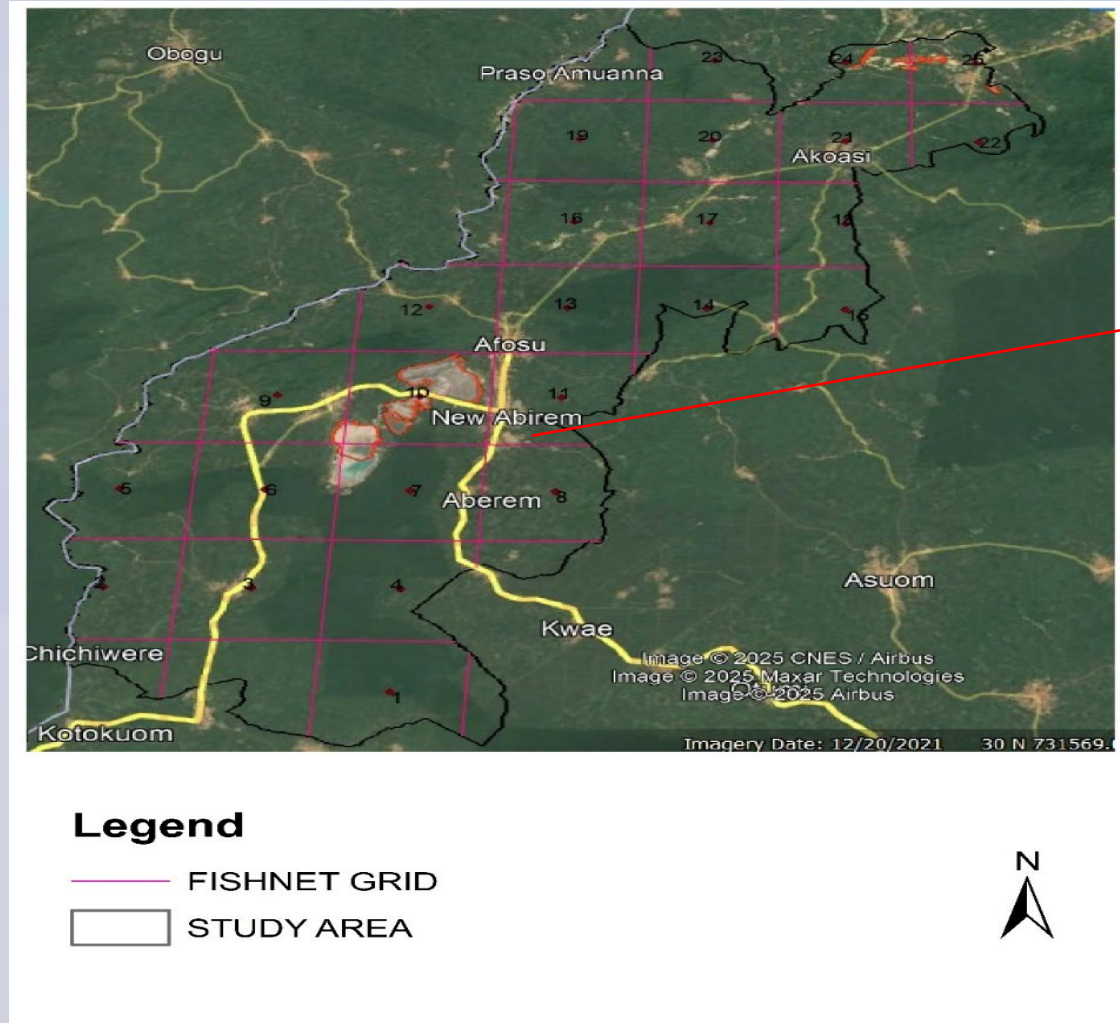

LULC Transition Matrix from 2010 to 2024 (km2).

| 2010 \ 2024 | Forest | Vegetation | Built-up area | Bare land | Mine Sites | Total (2010) |
|---------------|---------|------------|---------------|-----------|------------|--------------|
| Forest | 92.461 | 111.829 | 15.872 | 10.978 | 4.217 | 235.357 |
| Vegetation | 22.212 | 205.009 | 25.346 | 26.804 | 9.087 | 288.459 |
| Built-up area | 0.118 | 2.405 | 9.059 | 1.561 | 0.202 | 13.346 |
| Bare land | 2.358 | 22.227 | 1.643 | 3.391 | 0.220 | 29.838 |
| Total (2024) | 117.149 | 341.469 | 51.920 | 42.735 | 13.726 | 567 |

Accuracy- Assessment of LULC for 2010-2024

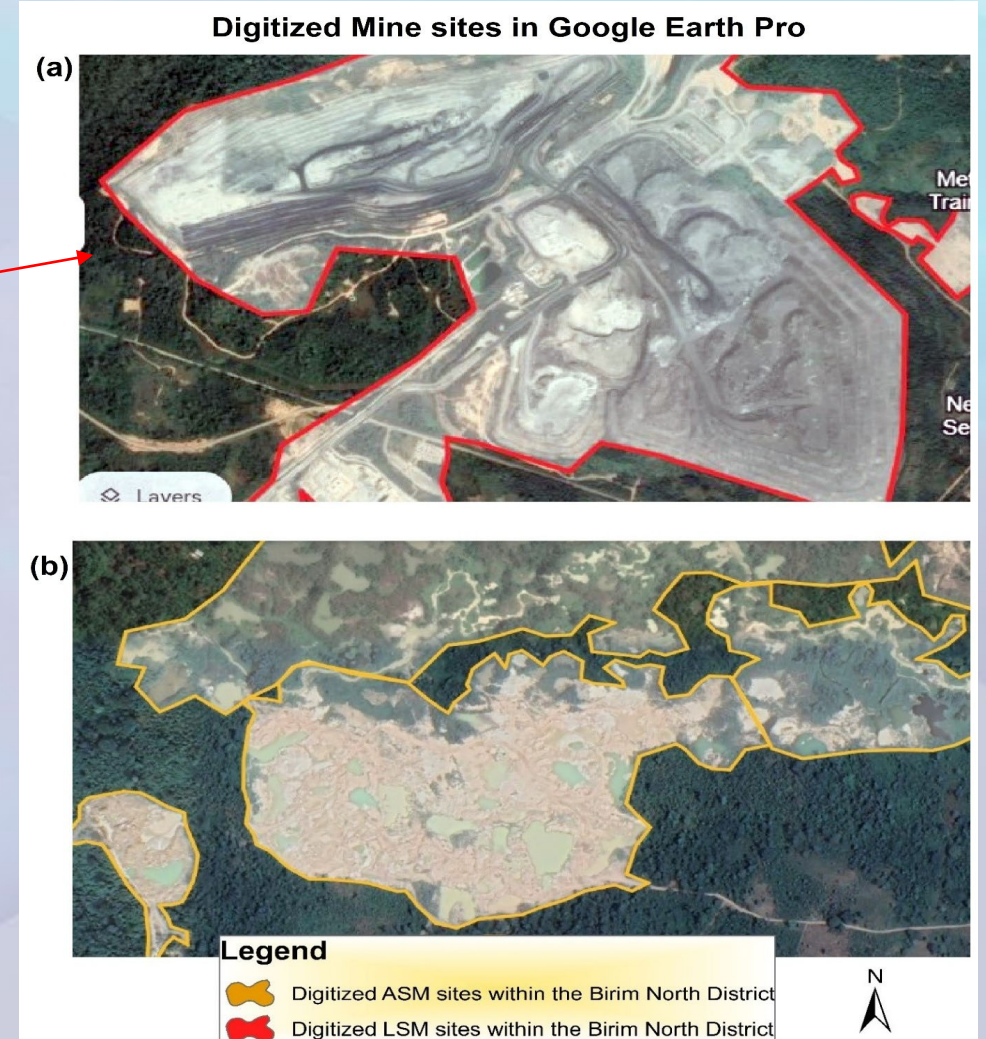

| Year | Overall Accuracy (%) | Kappa Coefficient |
|------|----------------------|-------------------|
| 2010 | 86.6 | 0.854225 |
| 2015 | 93.8 | 0.911259 |
| 2020 | 94.1 | 0.933625 |
| 2024 | 88.2 | 0.858665 |

RESULTS & DISCUSSION

Map showing the fishnet gridding of the study area used as a guide for ease of digitizing ASM and LSM sites in Google Earth Pro.

RESULTS & DISCUSSION

Digitized Mine sites within the study area (km²).

| Year / Time Period | ASM Site Area (m ²) | ASM Site Area (km ²) | LSM Site Area (m ²) | LSM Site Area (km ²) | ASM Change (%) | LSM Change (%) |
|-----------------------|------------------------------------|-------------------------------------|------------------------------------|-------------------------------------|----------------|----------------|
| 2015 | 1,452,563.50 | 1.4526 | 8,212,659 | 8.2127 | — | — |
| 2020 | 1,225,082.00 | 1.2251 | 9,129,594 | 9.1296 | -15.67 | +11.17 |
| 2024 | 3,301,555.08 | 3.3016 | 11,279,772 | 11.2798 | +169.50 | +23.56 |
| 2015–2024 | — | — | — | — | +127.30 | +37.34 |

RESULTS & DISCUSSION

- Mining Surge – ASM and LSM are main contributors to forest loss, bare land expansion, and soil degradation.
- Urbanization & Deforestation – Expanding settlements and tree loss intensify land degradation (Table 3).

Community perception on the impact of mining on land degradation.

SA = Strongly Agree, A = Agree, N = Neutral, D = Disagree, SD = Strongly Disagree. Longer dark green segments reflect stronger agreement.

RESULTS & DISCUSSION

Objective 2: Evidence of Rehabilitation Efforts in the study area and the perception of mining communities on restoration activities

- Natural Regeneration was the rehabilitation technique observed.
- Water and vegetation-covered pits pose health and safety risks.
- Some Abandoned pits are re-mined by locals.

Natural regeneration at an abandoned
ASM site

Re-mining of old abandoned pits
observed in the study area.

RESULTS & DISCUSSION

Community perception on Rehabilitation efforts and its effectiveness

Water-filled pits at a naturally regenerated ASM site, vegetation surrounding the flooded areas.

Rehabilitation Efforts

- Mining companies and ASM have a responsibility to rehabilitate lands after extraction (Mean: 4.49, Rank: 1st)
- Filling abandoned mine pits is necessary for land rehabilitation (Mean: 4.45, Rank: 2nd)
- Tree planting is an effective method for rehabilitating degraded land (Mean: 4.41, Rank: 3rd)
- There are laws in place that require ASM operators to rehabilitate degraded lands (Mean: 4.37, Rank: 4th)
- Rehabilitation efforts have significantly improved land conditions in this community (Mean: 2.7, Rank: 5th)
- The enforcement of rehabilitation policies for ASM activities is effective (Mean: 2.68, Rank: 6th)
- Local community members participate in land rehabilitation activities (Mean: 2.66, Rank: 7th)
- Mine pits are filled with soil after mining in this community (Mean: 2.61, Rank: 8th)
- Government agencies are actively involved in land rehabilitation efforts (Mean: 2.53, Rank: 9th)
- I am aware of rehabilitation efforts aimed at restoring degraded land in this community (Mean: 2.63, Rank: 10th)

Community perception of the effectiveness of land rehabilitation efforts. SA = Strongly Agree, A = Agree, N = Neutral, D = Disagree, SD = Strongly Disagree. Longer dark green segments reflect stronger agreement.

RESULTS & DISCUSSION

Objective 4: Drivers Influencing the Achievement of Land Degradation Neutrality

Enabling Drivers (Opportunities):

- Natural vegetation regeneration observed on abandoned mine sites.
- Strong community willingness to engage in rehabilitation.
- Training and awareness creation identified by 39% of respondents.
- Collaborative interventions proposed: 56% – joint training, 17% – law enforcement, 6% – education & taskforces, 3% – alternative livelihoods.

Constraining Drivers (Challenges):

- Weak enforcement of environmental regulations.
- Limited institutional & technical capacity for rehabilitation.
- Inadequate funding and poor disbursement.
- Low LDN policy awareness (72% unaware).
- Competing land uses (re-excavation, farm-to-ASM conversion).
- Rapid ASM expansion (+169.5% from 2020–2024) undermines neutrality.

RESULTS & DISCUSSION

Objective 4: Evaluating the Sustainability of Rehabilitation Practices

- **Natural Regeneration alone is insufficient** – Passive recovery fails to fully restore ecosystems.
- **No other structured methods** – Reforestation, phytoremediation, soil restoration required.
- **Capacity Gaps** – Limited expertise, and resources hinder rehabilitation.
- **Community Support** – Strong backing for training, involvement, and inclusive decision-making.
- **Policy & Enforcement Gaps** – High demand for stricter laws and mandatory post-mining rehabilitation.

CONCLUSION

- Severe land degradation due to loss of forest and rise in built-up and bare lands.
- Mining (illegal ASM) and urbanization are the dominant drivers of degradation.
- Rehabilitation efforts largely relied on natural regeneration.
- Weak enforcement and limited expertise hinder progress toward LDN.
- Current rehabilitation methods are unsustainable and require structured interventions.

RECOMMENDATION

- Implement reforestation and land restoration programmes to curb severe degradation.
- Enforce sustainable mining and land management practices.
- Shift from passive to active rehabilitation through pit refilling, phytoremediation, and afforestation.
- Enhance law enforcement and technical capacity to advance LDN progress.
- Foster collaboration and provide livelihood support for sustainable rehabilitation.
